Data Retrieval 2

Data Retrieval

Retrieval of data in **Aware IM** is achieved by means of a *data query* (or simply a *query*). A query goes through all data in the system and compares it against some criteria. The data that matches the criteria is retrieved. Since data in **Aware IM** is encapsulated in business objects (see [Business Objects as Carriers of Data](#)) a query looks for the instances of a business object that match the criteria of the query.

Data may be retrieved not only explicitly by a user but also by processes and business rules. This is achieved by executing the **FIND**, **PICK FROM** or **DISPLAY** actions of the Rule Language. Executing this action is equivalent to running a query – in fact, almost any query (other than very specific queries in SQL form) may be represented as a **FIND** action.
