Data Processing

As explained in the Business Rules as Carriers of Business Logic section in **AwareIM** data processing logic (or business logic) is configurable and centralized. It is expressed in the form of business rules rather than in a more traditional programming or scripting language. Implementation of this business logic is based on the fact that business rules get evaluated and their actions are executed as soon as the rule conditions are met.

This section explains in detail how this happens – how rule conditions are evaluated and what happens when rule actions are triggered.
