View Configuration Tool Settings

Existing settings of the Configuration Tool can be viewed if you select "File/Settings" command in the application menu of the Configuration Tool. The "Setup" dialog will pop up where you can specify whether the Configuration Tool is connected via LAN or HTTP. For the LAN connection you also need to specify the AwareIM server and port. For HTTP access you need to define the "Web URL" Web URL is used not only for HTTP access but also for the preview of forms, queries and visual perspectives, for the embedded browser used in testing and when using the Configuration Tool commands to log into the application. When defining a web url you should specify the server where AwareIM is installed, the port where Tomcat is running, the protocol used (HTTP or HTTPS) and the name of your web application (this is the name of the directory under the "Tomcat/webapps" directory which contains the AwareIM application. By default, the name of the directory is "AwareIM", but you can rename this directory).
