Managing Configuration Users

When you install AwareIM for the first time the default administrator use of the Configuration Tool is created. The login name of this user is "admin" and the password is "password". Additional users of the Configuration Tool can be created using the "Manage Configuration Users" command under the Edit menu. When this command is selected the "Manage Configuration Users" dialog is displayed. In this dialog you can add, delete and modify configuration users. When adding a configuration user the following properties can be specified:

- Login name
- Password
- Role (Administrator or Developer). The difference between administrators and developers is that developers cannot manage configuration users. Developers cannot put a business space version "in development" to start multi-developer mode and they cannot put version "in development" under test or publish it.
- Access to business spaces – an administrator can limit access to certain business spaces for different developers. If a developer has been disallowed access to a particular business space, this business space will not be visible to this developer in the Configuration Tool

Any user of the Configuration Tool can change his/here password by selecting the "Change Configurator Password" command under the Edit menu.

48. Concurrent Development
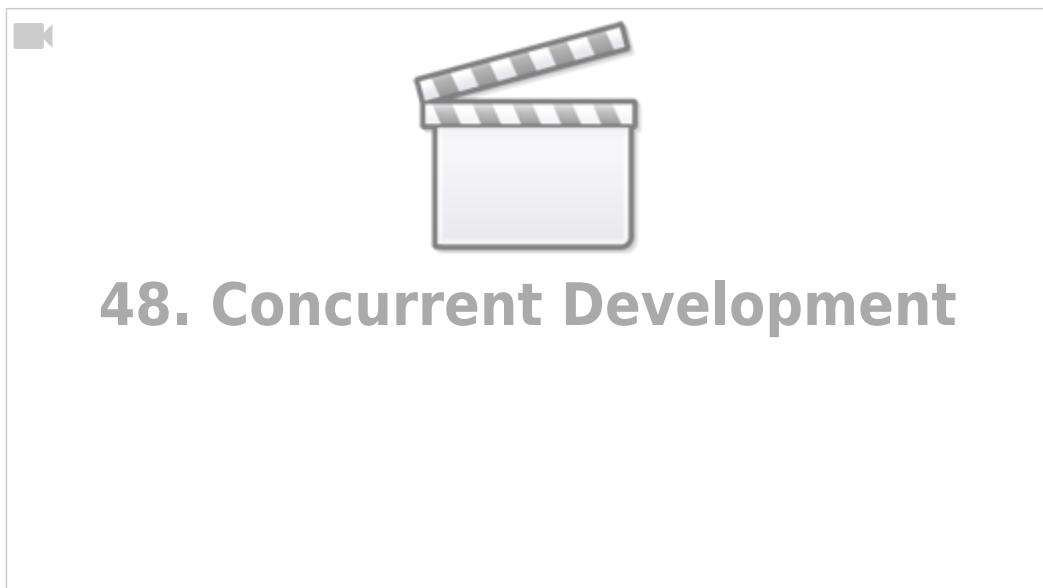

This video tutorial describes how several developers can work together on the same application.
