How To...

configure the system to send e-mails

To configure the application to send e-mails you need to do the following:

1. Define an intelligent business object representing the addressee of the e-mail with the communication channel of the “e-mail” type (see the “[Defining Intelligent Business Objects](#)” section).
2. Define a notification representing a particular e-mail (see “[Sending Outgoing E-mail](#)” section).
3. Define a business rule that would use the **SEND** action to send e-mail under particular circumstances – see the description of the **SEND** Action in the [AwareIM Rule Language Reference](#).

See also the “[Outgoing E-mail](#)” section.

send e-mail with attachments

To send e-mails with attachments you need to configure a notification representing a particular e-mail (see the “[Sending Outgoing E-mail](#)” section) and define attributes of the Document type that will hold the attachments – one attribute per attachment (see the “[Attributes of Document Type](#)” section). When you send e-mail using the **SEND** action you need to initialize these attributes with the particular documents (these can be generated reports, “merged documents” or ordinary files). **AwareIM** will automatically convert these documents into e-mail attachments. For example,

```
CREATE EmailToCustomer WITH EmailToCustomer.Attachment1='AnnualReport'  
SEND EmailToCustomer TO Customer
```

In this example `EmailToCustomer` is a notification representing the e-mail (the notification must have the Subject and Message attributes initialized to some text). This notification has the attribute `Attachment1` of the Document type. `AnnualReport` is the name of the document template of the Report type (see the “[Reports](#)” section). When initializing the `Attachment1` attribute **AwareIM** will generate the report, attach it to the attribute and convert it to the e-mail attachment when the e-mail is sent. Another example:

```
CREATE EmailToCustomer WITH EmailToCustomer.Attachment1='AnnualReport'  
IMPORT DOCUMENT EmailToCustomer.Attachment2 FROM 'c:\MyDocuments\myfile.bin'  
SEND EmailToCustomer TO Customer
```

In this example `EmailToCustomer` is assumed to have the second attribute of the Document type called `Attachment2`. After the notification has been created the value of this attribute is imported from file. When the e-mail is sent the file is converted to the e-mail attachment.

configure the system to receive e-mails

This is described in detail in the [“Incoming E-mail”](#) and [“Setting Options for Incoming E-mail Handling”](#) sections.

register (save) incoming e-mails in the system

You can ask **AwareIM** to register all incoming e-mails when you configure the properties of the incoming e-mail handling – see the [“Setting Options for Incoming E-mail Handling”](#) section.

process e-mail based on its contents

In order to process the received e-mails you need to define business rules attached to the event of receiving an e-mail notification – see the [“Incoming E-mail”](#) section. The rules may check the subject and/or body of the e-mail (or maybe who it is from and when it was sent) and perform the appropriate actions. For example,

```
IF IncomingEmail.Subject = 'Registration' AND IncomingEmail.From = 'John Smith' THEN ...
```

If e-mails contain complex information that you want to analyse then this information may be encoded into the body of the message in a special format (you have to mandate that the senders of such e-mails encode the bodies of their e-mails in this format). The format is described in the [SET Action](#) section of the [Rule Language Reference](#). Your rules can then decode the information contained in the body of the e-mail using the [SET](#) action. For example, if the body of the e-mail has the following string:

```
#Name#John Smith#State#NEW#Balance#100.0
```

Then the following rule:

```
SET Account FROM IncomingEmail.Message
```

will set the Name, State and Balance attributes of the Account objects to the values provided in the body of the e-mail ('John Smith', 'NEW' and 100.0). You can define other rules that will check these values and perform the appropriate actions if required.

To perform “mail-merge” of your outgoing e-mails do the following:

1. Define a notification representing the e-mail – see the [“Sending Outgoing E-mail”](#) section, [0930_email_config](#)
2. Provide the initial values to the Message and Subject attributes of the e-mail notification to include the body and subject of your e-mail respectively (see the [“Common Properties”](#) section). Use tags inside the initialization text for those parts of the body and/or subject that will be “mail merged”. **AwareIM** will replace the tags with the appropriate values when the e-mail is sent. Below is an example of the initialization text for the Message attribute:

Dear <<Policy.Holder.Name>>,

Your policy **is** about **to** expire on <<Policy.ExpiryDate>>

send e-mails in HTML format

To send e-mails in the HTML format first define the text of the e-mail as HTML document template (see the “[Adding/Editing Document Templates](#)” section). After that add an email notification as described in [0930_email_config](#). This notification will have the predefined HTMLMessage attribute of the Document type. Set initial value of this attribute to the name of the HTML document template. Then define a rule to send this e-mail as usual.
