How to display thumbnails - images with descriptions that the user can tap on

This feature is very often used in mobile applications. To create a thumbnail view use a custom presentation of query results. See the “[Displaying Query Results](#)” section (“[Custom Presentation](#)” – thumbnail view presentation template). You can use either the “custom template” option or a “custom mobile template” option. The latter uses a special widget that supports grouping, infinite scrolling checkbox selection and operations.

If you use the “custom template” you will be able to use a “scroll view”, which is very popular for mobile applications – it displays one image at a time and users can swipe to the next or previous image.
