Writing client-side plugins 2

[Programmers Reference](#), [Client Side Plugins](#)

Writing client-side plugins

In **AwareIM** you can not only add plugins for the server (such as custom processes, channels or functions), but you can also add plugins that execute on the client within a web browser. Most of the time you would write these plugins in order to add your custom user interface functionality, or modify the default **AwareIM** user interface behaviour.

All client-side plugins must be written in Javascript and in most cases you need the knowledge of the [Kendo UI](#) Javascript library from Telerik and a popular open source Javascript library called [jQuery](#) . The description that follows assumes that the reader is familiar with Javascript, Kendo UI library and jQuery.

There are several types of the client-side plugins you can add in **AwareIM**:

- Modify the default behaviour and presentation of forms
- Modify the default behaviour and presentation of form sections in forms
- Modify the default presentation of individual fields within forms
- Modify the default presentation and behaviour of queries
- Modify the default presentation and behaviour of content panels inside visual perspectives

We will look at each of these client-side plugins separately

- [Architecture of the client-side code](#)
- [Modifying default behavior and presentation of queries](#)
- [Modifying default behavior and presentation of forms](#)
- [Modifying default behavior and presentation of form sections](#)
- [Modifying default presentation of individual fields on forms](#)
- [Modifying default behavior of menu in visual perspectives](#)
- [Modifying default behavior and presentation of content panels in visual perspectives](#)
- [AwareApp object](#)
- [Using Javascript to integrate custom Cordova plugins for native mobile applications](#)
