## Business object group

A business object group allows for uniform handling of [business objects](#) of different [#HelpGlossaryObjectTypeAndInstance|types](#). It offers the convenience of establishing links to various business objects in one place. For example, a Transaction group may be created to embrace all possible transactions that can be applied to an account, where a separate object represents each transaction type. An Account business object may have an [attribute](#) that is a [multiple\\_reference](#) to the Transaction group. In this way transactions of different types would be registered with the account in a single list.
