Intelligent business object 2

Intelligent business object

In addition to a collection of attributes that [ordinary business objects](#) have, intelligent business objects are capable of processing information and communicating in a meaningful way. This includes human beings, software systems and electronic devices. For example, a customer would be an intelligent object because an organization needs to keep certain information about its customers, and may need to communicate with them. **Aware IM** can communicate with intelligent objects via [communication channels](#) in two ways: sending [notifications](#) or requesting [services](#).

A [business space](#) in **Aware IM** is an intelligent business object because it can both communicate and process information. The information is processed according to the [rules](#) defined in the business space. As far as communication is concerned, a business space can both provide [services](#) and handle incoming [notifications](#).
