**Notification** ..... 2

# Notification

A notification is a way of communicating where a party can send a message to another party without having to identify itself and without expecting a reply back from the other party. It is entirely up to the other party to decide how to react upon receiving the notification. An e-mail is a good notification example.

**aware\_im** allows sending notifications from a **business space** to **intelligent business objects** defined in the business space, for example sending e-mails to customers. It also forwards incoming notifications into relevant business spaces, for example when an incoming e-mail arrives or a user **logs** into the business space in the **operation mode**.

Notifications, like business objects, have **attributes** to hold communication information.
