Query SQL form 2

Query SQL form

The SQL form is a section of the query editor in the [Configuration Tool](#) where the [configurator](#) can specify a [query](#) using the SQL, a language that database management systems understand. It can be used by SQL experts for queries that are too complex to be defined in the [simple form](#) and, for some reasons, cannot be specified using the rule form. For example, a query in the SQL form that finds all members over 16 years old and lists them in the alphabetical order may look like this:

```
SELECT
  Member.*
FROM
  Library_Member AS Member
WHERE
  (Member.Age > 16) ORDER BY Member.LastName
```

This particular example can also be specified using the [simple form](#).
