Process input 2

Process input

If a [process](#) needs one or several [business objects](#) to work properly, a [configurator](#) should declare such objects as the process input. When the process is executed in the [operation mode](#) these objects will form the initial [context](#) for the process.

AwareIM uses the process input information for various purposes, for example when looking for [object operations](#) for a particular business object, or when determining [service input](#) for a [service](#).
