Rule evaluation

Rule evaluation is a process of **AwareIM** considering [rules](#) to determine whether their [actions](#) need to be executed. **Aware IM** evaluates rules attached to a configuration element when an event happens that affects that element. For example, when a [business object](#) is modified or a [process](#) is started. When such an event takes place **Aware IM** evaluates all rules in the relevant [rule collection](#). How evaluation is performed depends on the [rule order](#) in the rule collection.
