Rule evaluation 2

Rule evaluation

Rule evaluation is a process of **AwareIM** considering **rules** to determine whether their **actions** need to be executed. **Aware IM** evaluates rules attached to a configuration element when an event happens that affects that element. For example, when a **business object** is modified or a **process** is started. When such an event takes place **Aware IM** evaluates all rules in the relevant **rule collection**. How evaluation is performed depends on the **rule order** in the rule collection.
