getAttributeValue (String)

```
public Object getAttributeValue (String attributeName)
throws InvalidParameterException
```

This method returns the value of the specified attribute. Note: the attribute must not be a reference. Use the getReferences method to retrieve references.

Parameters

attributeName	the name of the attribute of the business object or notification the value of which is returned

Returns

The value of the attribute as `Object`. The type of the object corresponds to the type of the attribute. See the Appendix A that provides the mapping between attribute types and Java types.

Throws

InvalidParameterException	if the specified attribute name does not exist in the business object or notification
